

---

## ? Is `char` → `int` the same as `boolean` → `int` in Java?

👉 No — completely different

- `boolean` → `int` ❌ NOT allowed
- `char` → `int` ✅ ALLOWED

---

## ♦ Why is `char` → `int` allowed?

In **Java**, a `char` is internally stored as a **numeric Unicode value**.

So every character has an **integer code point**.

Example:

- `'A'` → 65
- `'a'` → 97
- `'0'` → 48

So when you convert a `char` to `int`, you're just getting its **Unicode number**.

---

## ✅ Example: `char` → `int`

```
char ch = 'A';  
int x = ch;
```

```
System.out.println(x); // 65
```

- ✓ This works automatically
  - ✓ No casting needed
-

## ◆ You can also cast explicitly

```
char ch = 'A';  
int x = (int) ch;
```

```
System.out.println(x); // 65
```

Same result 👍

---

## Reverse: int → char

Also allowed:

```
int x = 66;  
char ch = (char) x;
```

```
System.out.println(ch); // B
```

---

## Why this works but boolean doesn't

Because Java categorizes types like this:

### Numeric types

- `byte`, `short`, `int`, `long`, `float`, `double`, `char`

👉 These are all **interconvertible (with casting rules)**

---

### Non-numeric type

- `boolean`

👉 `boolean` is **not numeric at all**, so Java does not allow conversion.

---

## Easy way to remember

👉 `char` is secretly a **number** (Unicode)

👉 `boolean` is **pure logic** (true/false)

So:

| Conversion                              | Allowed?          |
|-----------------------------------------|-------------------|
| <code>char</code> → <code>int</code>    | ✅ yes             |
| <code>int</code> → <code>char</code>    | ✅ yes (with cast) |
| <code>boolean</code> → <code>int</code> | ❌ no              |
| <code>int</code> → <code>boolean</code> | ❌ no              |

---

## Interesting trick question

What will this print?

```
System.out.println('A' + 1);
```

👉 Output:

66

Because:

- `'A'` → 65
  - `65 + 1 = 66`
- 

## Interview one-liner

If asked:

Is char to int conversion allowed in Java?

Answer:

Yes. In Java, `char` is a 16-bit Unicode numeric type, so it can be implicitly converted to `int`. But `boolean` cannot be converted to numeric types because it is not a numeric type.
